PROFILE

Technical game designer with 5+ years of professional experience on multiplayer and live-service games in Unreal Engine and Unity, and three shipped commercial titles.

I own features from design through release, prototype gameplay in Blueprints and C++, balance combat, progression and economy systems, and work closely with engineering teams.

My technical background lets me build prototypes and internal production tools myself and iterate on gameplay quickly.

Built 50+ mechanics across shipped games and personal projects in C#, C++ and Blueprints.

Lead two junior designers in a team of 10 game designers.

CORE COMPETENCIES

Weapon & combat mechanics • In-engine implementation (Blueprints / C++) • Rapid prototyping & iteration • Systems integration • Vehicle & locomotion prototyping • Design & technical documentation • Cross-department collaboration • Tools & workflow improvement • Mentoring & feedback • Balance & economy • Systemic design

TECHNICAL SKILLS

Design	Weapon & combat mechanics, gameplay systems integration, rapid prototyping & iteration, vehicle/locomotion prototyping, player progression, economy design, design & technical documentation
Unreal Engine	Blueprints, C++ gameplay programming, Gameplay Tags, Enhanced Input, Animation Blueprints, Behavior Trees, AI Controllers, State Machines, Data Tables, Primary Data Assets, NavMesh, Gameplay Debugging
Unity	C#, MonoBehaviour, ScriptableObjects, NavMesh, gameplay implementation & prototyping
Programming	C++, C#, Python
Tools	Git, Bitbucket, Jira, Confluence, Miro, Rider, Visual Studio, Excel / Google Sheets, Looker Studio

PROFESSIONAL EXPERIENCE

Game Designer (Balance / Technical) — GFAGAMES

Nov 2024 — Present

Project: PIONER (Steam, released December 2025) — open-world MMO shooter, Unreal Engine; team of ~70

- Balance almost every game system: combat, economy, progression, loot, crafting, vendor pricing. In my first ~7 months, a colleague and I rebalanced the entire game; calculated stats for 50+ enemy types, from regular mobs to bosses. Introduced a weapon power score based on effective TTK and DPS, so weapons work in both PvP and PvE while staying distinct.
- Write and maintain balance tables and feature specs.
- Built a C++ tool that walks a level and exports every loot spawner (~3,000 on the largest map) with its loot tables and expected item counts to CSV, so loot can be balanced across the whole map in spreadsheets; now used by designers in my department and by level designers.
- Owned many mechanics from spec to Blueprints, including hip-fire spread with an honest crosshair and a full rework of the perk system, and integrated them without breaking existing systems.
- Prototype and iterate on weapons, armor, consumables and enemies for live updates, based on internal testing and player feedback.
- Lead two junior designers: set tasks and review design docs; redesigned the friends, chat and clan UX with one of them.

- Spotted a grenade readability problem (smoke and damage-zone edges) and got it fixed through a junior designer.
- Work closely with engineers and artists to take new weapons and systems from concept to live content.

Technical Game Designer — 101XP

Mar 2023 — Nov 2024

Project: The Braves (Steam, released) — live-service action game in the spirit of Vampire Survivors, Unity; team of ~30, 5 game designers

- Wrote 25+ specs for artists and programmers and owned many mechanics (hero skills, weapon behaviors, boss variations) from concept through implementation and balance.
- Built a UI-automation script that moves data from Google Sheets into a browser-only admin panel with no API, making content setup 10× faster.
- Designed gamepad controls for every screen, including a single Sony / Xbox / Nintendo layout table in the spec; the player profile (achievement showcase, frames, avatars) took two design iterations.
- Set up content for live updates, tuned enemy difficulty, rewards and the gacha economy; calculated gacha drop rates for seasonal events.
- Tracked retention, monetization and hero/gear stats daily in Looker Studio and used them in content and shop decisions.

Technical Game Designer — 101XP

Dec 2022 — Mar 2023

Project: Craft of Survival (Google Play, released) — single-player survival RPG, Unity

- First project after moving from QA into design: set up new content for regular updates.
- When most of the team left, a colleague and I shipped a major update on schedule with no critical bugs; I owned the new location, enemies and content.

QA Specialist — 101XP

May 2021 — Dec 2022

- A Random Dice-style PvP tower defense with a short update cycle; in a ~15-person team also coordinated task readiness with programmers and ran and published builds. From December 2022 I worked full-time as a game designer; my official title changed to Technical Game Designer only in February 2024.

PERSONAL PROJECTS

Unreal Engine Helicopter Prototype — Flight model built on real aerodynamic formulas, plus a nose turret; C++ core, Blueprint content. (2025)

Bot Arena (Unity) — Arena shooter against waves of drones, with an attack-token queue and parameter-driven difficulty. github.com/KhazirovTimur/BotArena (2023)

Tiny Dozzer (Mobile) — Physics arcade game in Unity, built solo in about a month and released on Google Play. (2021)

EDUCATION & CERTIFICATIONS

- Bauman Moscow State Technical University: Specialist degree (5-year, equivalent to Bachelor’s + Master’s), Information Security, 2022
- Michigan State University: Introduction to Game Development (Coursera certificate)
- Michigan State University: Principles of Game Design (Coursera certificate)

ADDITIONAL SKILLS

Blender (basic) • Adobe Photoshop, Premiere • Basic SFX and music creation • Ableton Live, Reaper

LANGUAGES

Russian: Native | English: C1
